RUSH sequence search request for 10/083,336

Hello Christina,

Please authorize the request below as RUSH. The reason being this is an amended due this biweek and the previous search I did is incomplete.

Thanks Manjunath

Please search the following as soon as possible for application with serial number 10/083,336

1. SEQ ID NO:1, 2, 3, and 4 against all <u>commercial protein databases</u> including <u>issued</u> <u>patents database</u> and <u>pending application database</u> and provide a print of <u>all</u> results.

If you have any questions please call me at the above phone number.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A_Geneseq_19Jun03:*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            receptors, resulting in cessation of protein synthesis and death of target cells. Claimed hybrid proteins comprise a translocation domain and a cell binding domain from e.g. a hormone, growth factor or polypeptide toxin. The hybrid molecules can be used for the delivery of agents (e.g. therapeutic genes, toxins, detectable labels) into cells. The use of a translocation mechanism ensures that the hybrid will be effective in relatively low doses, since a high proportion of the substance of interest will be taken into the targeted cells. The hybrid molecules can be manufactured as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This polypeptide comprises the castorbean cytotoxin, ricin. DNA (see AAT91638) encoding the enzymatic A domain and a portion of the A-to-B linker peptide of ricin was used to construct a ricin-diphtheria toxin B'-interleukin-2 gene that was expressed in E. coli. The hybrid protein can be isolated and used to treat conditions involving over-production of cells bearing IL2 receptors, such as certain T-cell lymphomas and organ transplant rejection crises. The hybrid inactivates ribosomes in cells bearing IL2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           single hybrid recombinant protein, permitting reproducibility, consistency, and the precise control of composition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Вþ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ş
protein comprising three parts: (a) the first part comprises a portion of the binding domain of a cell-binding polypeptide ligand allowing the hybrid protein to bind to an animal cell; (b) the second part comprises a portion of a translocation domain of a naturally occurring protein selected from diphtheria toxin, botulinum neurotoxin, ricin, cholera toxin, T toxin, C3 toxin, shiga-like toxin, pertussis toxin and tetanus toxin, which translocate the third part of the across the cytoplasmic membrane into the cytosol of the cell; and (c) the third part comprises a polypeptide entity to be introduced into the cell, which is non-native to the naturally occurring protein of (b). This sequence represents the Castor bean ricin toxin sequence for use in generating the bybrid of the hybrid of the comprises the castor bean ricin toxin sequence for use in generating the bybrid of the hybrid of the comprises the castor bean ricin toxin sequence for use in generating the hybrid of the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the castor bean ricin toxin sequence for use in generating the hybrid of the castor be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               particular enzyme or a scarce precursor or cofactor, to directing toxins or other poisons to destroy particular cells (such as adipocytes, cancer cell, or virus infected cells), to counteracting viral infections such as HIV, by introducing appropriate antibodies to viral process. It is also involved in the process of getting non-therapeutic substances such as detectable labels into cells.

The hybrid molecule enables the direction of appropriate therapy to affected cells, allowing them to function properly and alleviate or cure the disease. The hybrid is especially used in treating genetic deficiency diseases, by delivering to affected cells an enzyme

This sequence represents the Ricinus communis ricin protein sequence. The CC toxin can be included in the hybrid protein of the invention and used to CC destroy or modify the cell that the hybrid protein is targeted to. The CC hybrid protein comprises a first part which is a portion of the binding CC domain of a cell of an animal. The second part comprises a portion of a CC translocation domain of a naturally occurring protein (e.g. the third part across the cytoplasmic membrane and into the cytosol of CC the third part across the cytoplasmic membrane and into the cytosol of CC into the cell, where each of the first and third part is non-native with CC respect to naturally occurring protein, and the covalent bond attaching CC the second and third part is cleavable. The toxin represented by the CC present sequence can form part of the third portion of the hybrid CC protein. The cell binding domain binds to a specific cell and the CC translocation domain transfers the hybrid molecule across the cell CC translocation domain through a cleavable bond, can then carry out its CC function. The hybrid molecules are useful for treating genetic deficiency CC diseases by delivering to affected cells an enzyme supplying the missing CC scarce precursor or cofactor, to direct toxins or other poisons to CC destroy particular cells (such as adipocytes, cancer cells, or virus-infected cells), and to counteract viral infections such as HIV by introducing into appropriate cells antibodies to viral proteins.

```
Novel composition comprising toxin e.g., ricin based antiviral compound useful for treating viral infections such as human immunodeficiency
virus infection.
```

Page 50-54; 66pp; English.

invention is useful for treating human immunodeficiency virus infection and other viral infections, especially retroviral infections. The antiviral agent is activated in viral particles or early-stage infected cells, killing the cells upon infection and effectively preventing the integration of the viral genome into the host genome thereby preventing the latency/rebound problem. The agent enters all HIV susceptible cells, and not just cells known to act as host cells for the virus. The antiviral agent remains inert in a cell until degraded in it, unless the cell is infected with the virus, where the viral protease activates it. The sequence relates to preproricin protein encoded by the DNA sequence given in AAI64138. The invention relates to a novel toxin (e.g., ricin) based antiviral agent which is toxic to virus-infected cells, but non-toxic to uninfected cells. The invention has anti-HIV and virucide activities. Its mechanism of action is through inactivation of cellular ribosomes and enhancement of binding of the antiviral agent to galactose residues on cell surfaces, and its cellular internalisation. The

                                                                                                                                                                                                 The sequence relates to preproricin protein encoded by the DNA sequence given in AAI64139. The invention relates to a novel toxin (e.g., ricin) based antiviral agent which is toxic to virus-infected cells, but non-toxic to uninfected cells. The invention has anti-HIV and virucide activities. Its mechanism of action is through inactivation of cellular ribosomes and enhancement of binding of the antiviral agent to galactose residues on cell surfaces, and its cellular internalisation. The cell surfaces, and its cellular internalisation. The and other viral infections, especially retroviral infections. The cantiviral agent is activated in viral particles or early-stage infected cells, killing the cells upon infection and effectively preventing the integration of the viral genome into the host genome thereby preventing the latency/rebound problem. The agent enters all HIV susceptible cells, and not just cells known to act as host cells for the virus. The cell is infected with the virus, where the viral protease activates it.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The full-length sequences encoding ricin A (AAN70520), ricin D (AAN70525), putative ricin E (AAN70520) and RCA (AAN70524) in precursor form were obtd. using messenger RNA to obtain a cDNA library, and then probing the library to retrieve the desired cDNA inserts. The library was probed using the 35-mer given in AAN70514. Figure 4 (see AAN70520, AAN70521) AAN70521) shows the nucleotide sequences of three cc plasmids contg. cDNA inserts obtd. by probing a cDNA library for sequences encoding ricin B using the probe in AAN70517. The cDNA linserts can be placed into expression vectors. Site-directed mutagenesis may be used to place an AFG start codon and a Hindill cc site at the beginning of the mature protein (see AAN70518). The ccoding sequences of the inserts can be ligated into expression vectors contg. the phoA promoter-operator and leader sequence (AAN70533) and suitable retroregulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

The library was probed using the 35-mer given in AAN70514. Figure 4 (see AAN70520, AAN70521, AAN70522), shows the nucleotide sequences of three plasmids containing cDNA inserts obtained by probing a cDNA library for sequences encoding ricin B using the probe in AAN70517. The cDNA inserts can be placed into expression vectors. Site-directed mutagenesis may be used to place an ANG start codon and a HindIII site at the beginning of the mature protein, (see AAN70518). The coding sequences of the inserts can be ligated into expression vectors containing the PhoA promoter-operator and leader sequence (AAN70523) and suitable retroregulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                                                                                                                                                                                                                             preproricin is the whole polypeptide encoded by AAN50202 and the DNA encoding this is claimed. Proricin is obtained from preproricin by removal of the AA leader sequence. The linker AA sequence which is present in the precursor polypeptide is enzymatically removed in the cell to separate the A and B chains, which are joined by a disulphide bridge during the formation of the ricin molecule itself. This linker region as well as the presumptive amino terminal leader

The antiviral agent is activated in viral particles or early stage infected cells, killing the cells upon infection and effectively preventing the integration of the viral genome into the host genome thereby preventing the latency/rebound problem. The agent enters all HIV susceptible cells, and not just cells known to act as host cells for the virus. The antiviral agent remains inert in a cell until degraded in it, unless the cell is infected with the virus, where the viral protease activates it.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence relates to preproricin protein encoded by the DNA sequence given in AAI64137. The invention relates to a novel toxin (e.g., ricin) based antiviral agent which is toxic to virus-infected cells, but non-toxic to uninfected cells. The invention has anti-HIV and virucide activities. Its mechanism of action is through inactivation of cellular ribosomes and enhancement of binding of the antiviral agent to galactose residues on cell surfaces, and its cellular internalisation. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence relates to the amino acid sequence of a modified preproricin CC protein encoded by AAI64145. The invention relates to a novel toxin CC (e.g. ricin) based antiviral agent which is toxic to virus-infected CC cells, but non-toxic to uninfected cells. The invention has anti-HTV and CC virucide activities. The agent is able to enter all HTV susceptible CC cells, and not just cells known to act as host cells for the virus. The CC antiviral agent remains inert in a cell unless the cell is infected CC with the HTV virus, where the viral protease activates it. Ricin's CC mechanism of action is through inactivation of cellular ribosomes and CC enhancement of binding of the antiviral agent to galactose residues on CC cell surfaces, and its cellular internalisation. The invention is useful CC infections, especially retroviral infections. The antiviral agent is activated in viral particles or early-stage infected cells, killing the CC cells upon infection and effectively preventing the latency/rebound contact in the host genome thereby preventing the latency/rebound

                                                                                                                                      ribosomes and hence preventing protein production. Many different ribosome inhibitory proteins (RIPs) may be produced with an internal linker including maize RIP, Trichosanthin, Ricin A-chain, Abrin-A A-c and Saporin. The RIPs can be used in the construction of therapeutic toxins targeted to specific cells such as tumour cells via the attachment of a targeting polypeptide, e.g., a monoclonal antibody. A further use is in HTV therapy (see US4869903). There is interest in expressing RIP recombinantly in host eukaryotic cells, because of the processing RIP recombinantly in host eukaryotic cells, because of
                                                                     the capacity to provide correct post-translational processing. However, RIPs effectively inhibit protein synthesis in eukaryotic cells resulting in cell death. Since the inactive RIP proteins are not cycloxic to eukaryotic cells, they can be recombinantly expressed in such cells and
                                                                                                                                                                                                                                                                                engineered to contain a selectively removable internal peptide li sequence separating the alpha and beta units. When separated the units regain activity and are capable of inactivating eukaryotic
                                                                                                                                                                                                                                                                                                                    AAW25143 shows a castor oil plant agglutinin protein which was engineered to contain a selectively removable internal peptide
                                                                                                                                                                                                                                                                                                                                                                          Claim 4; Column 121-124; 186pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                              DNA encoding pro-ribosome inactivating proteins - precursors of ribosome inactivating proteins; can eukaryotic cells without causing cell death

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequences given in AAW21698-710 represent Ribosome Inactivating CC Proteins (RIP's), which may be used in the construction of the protein of the invention. The proRIP has a selectively removable, CC internal peptide linker. The proRIP has a selectively removable, CC internal peptide linker. The precursor sequence is incapable of inactivating eukaryotic ribosomes, but can be converted by removal CC of the linker into a protein having alpha and beta fragments and being CC capable of inactivating eukaryotic ribosomes. RIPs are potent CC inhibitors of eukaryotic protein synthesis. They possess a highly CC specific N-glycosidase activity which cleaves the glycosidic bond of CC adenine 4324 of rat liver ribosomal 28S RNA. RIP's selectively inhibit CC cellular proliferation of cells, e.g. cancer cells and HIV-infected TCC cells. The inactive proRIP proteins make it possible to provide protein CC synthesis inhibitors with uses in practical and improved ways not before CC possible. The RIP can be used to make cycotoxic conjugates.

Patent No. 5646026

Patent No. 5646026

Patent No. 5646026

Patent No. 5646026 5646119

GENERAL INFORMATION:
APPLICANT: HEY, TIMOTHY D

APPLICANT: HEY, TIMOTHY D

APPLICANT: MORGAN, ALIGE ER

TITLE OF INVENTION: RIBOSOME-INACTIVATING PROTEINS, INACTIVE

TITLE OF INVENTION: USING

NUMBER OF SEQUENCES: 81

NUMBER OF SEQUENCES: 81
                                                                                                                                                                                                                                                                                                                                                                                                            δõ
                                                                                                                                                                                                                                                                                                                                                                                                                                            Вр
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             В

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GENERAL INFORMATION:
APPLICANT: McDonald, John R.
APPLICANT: Coggins, Philip
TITLE OF INVENTION: METHODS AND COMPOSITIONS FOR TREATING SECONDARY TISSUE DAMAGE,
TITLE OF INVENTION: OTHER INFLAMMATORY CONDITIONS AND DISORDERS
FILE REFERENCE: 25020-601D
CURRENT APPLICATION NUMBER: US/09/792,793A
CURRENT FILING DATE: 2001-02-22
NUMBER OF SEQ ID NOS: 93
                                                                                                          SEQ ID NO 8
